a PerkinElmer Company

cryoPREP® Product Line

The non-contact, rapid, dry cryo-pulverization
system for biological tissue

Biomolecule Extraction using Covaris Products

Tissue Disruption for Downstream Analytical Applications

Covaris dry cryo-pulverization systems have been designed to simplify tissue processing workflows. Tissues are collected in Covaris [tissueTUBE](#)s, flash-frozen in liquid nitrogen, pulverized, and then transferred to a Covaris tube for extraction powered by Adaptive Focused Acoustics® (AFA®). The Covaris cryoPREP system is used to process tissues and extract biomolecules from a wide range of masses for downstream analyses including next-generation sequencing (NGS), qPCR, Microarrays, Mass Spectrometry (MS), GC-MS, NMR, and other detection methods.

Flash-freeze in liquid nitrogen

Flash-freeze the sample in liquid nitrogen to thermally stabilize biomolecules. Samples may be stored at -80 °C.

Dry pulverize with cryoPREP

Dry pulverize the sample to increase surface area and disrupt extracellular matrix without the need for use of organic solvents. Samples may be stored at -80 °C.

Lyse with AFA-energetics®

Acoustically extract biomolecule in an appropriate stabilizing buffer prior to purification or analysis.

tissueTUBEs

- tissueTUBEs have an expiration date due to the manufacturing process of heat shrinking the material
- Must be vented during processing in the cryoPREP

The CP03 is designed to make smaller pieces that can then be further processed or pulverized using the CP01 or CP02. The TT3 is a bag and a plastic clip. The sample is added to the TT3 bag and the bag is folded over 1 time for the plastic clip to seal it (like a chip clip).
